PSL Introduction

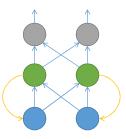

- Recurrent neural networks have been an important focus of research and development during the 1990's. → It is much older than ConvNet!
- They are designed to learn sequential or time varying patterns.
- A recurrent net is a neural network with feedback (closed loop) connections [Fausett, 1994]. Examples include BAM, Hopfield, Boltzmann machine, and recurrent backpropagation nets [Hecht-Nielsen, 1990].
- A dynamic neural network can be defined as a neural networks that consists of interlayer feedback loops (i.e., from output layer to input layer) and intra-layer feedback loops (i.e., between different neurons within the same layer) or self-feedback loops.
- From the computational perspective, a dynamic neural network that contains the feedback loop that may provide more computational advantages than a static neural network, which contains only feed-forward architecture
- Applications: natural language processing (NLP), forecasting, signal processing and control require the treatment of dynamics associated with the unknown model.

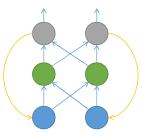

3

PSL™ Old style of RNN

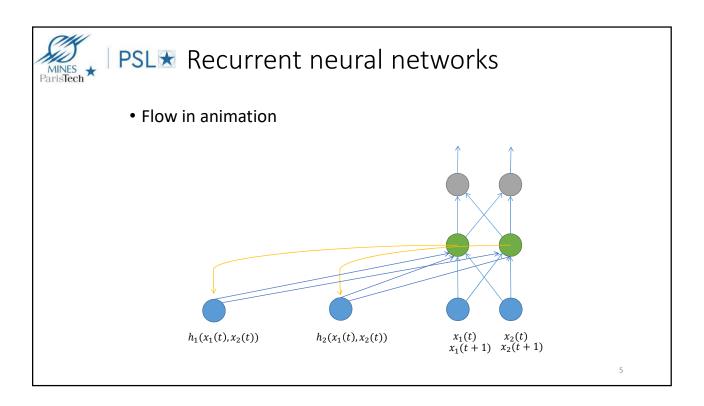

- Elman introduced feedback from the hidden layer to the context portion of the input layer.
 - This approach pays more attention to the sequence of input values.
- Jordan recurrent neural networks, Jordan use feedback from the output layer to the context nodes of the input layer and give more emphasis to the sequence of output values.

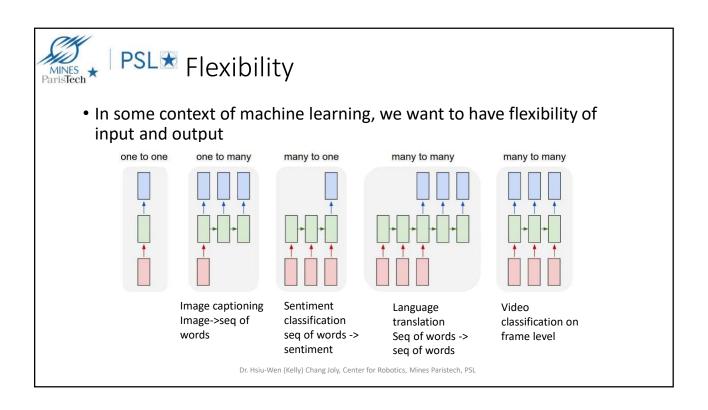

However, these methods did not succeed in bigger data set due to the design of gradient flow

4

PSL Gradient flow

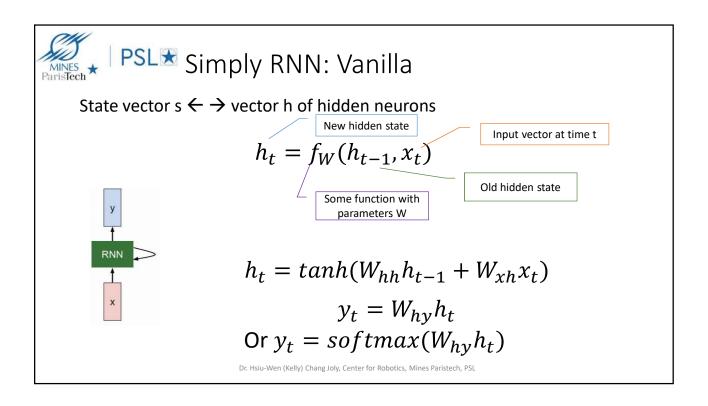

- Gradient flow is very important in network
- We already saw a lots in the last section
- Risk to have feed-back connection:
 - stability,
 - Controllability
 - Observability

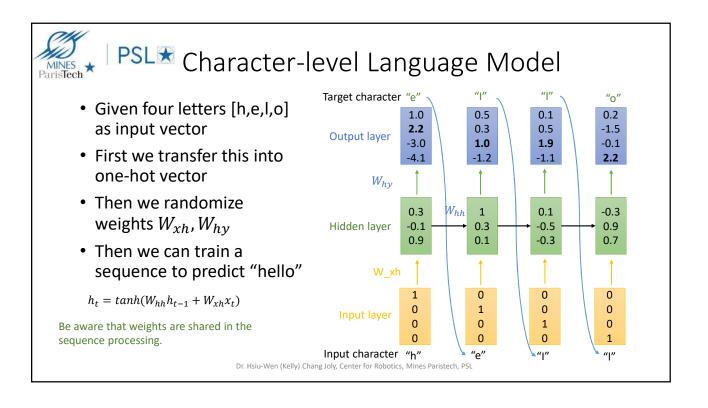

Dr. Hsiu-Wen (Kelly) Chang Joly, Center for Robotics, Mines Paristech, PSL

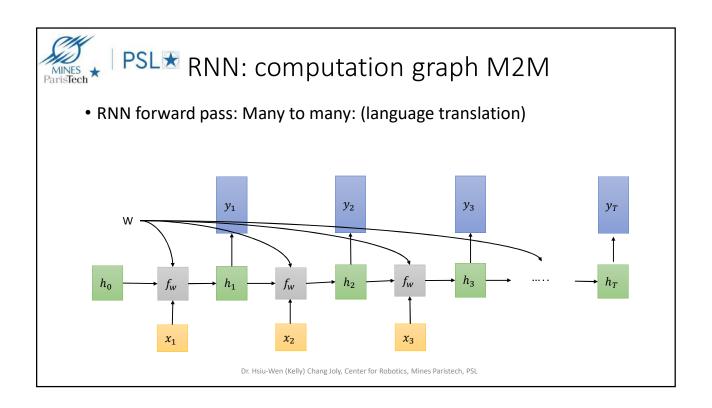

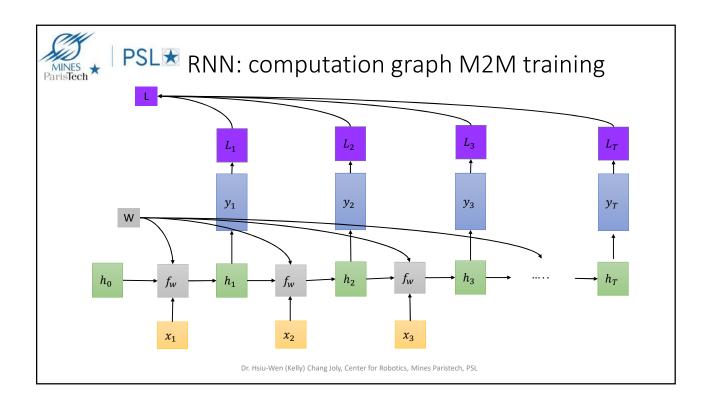

PSL™ Advantages of RNN

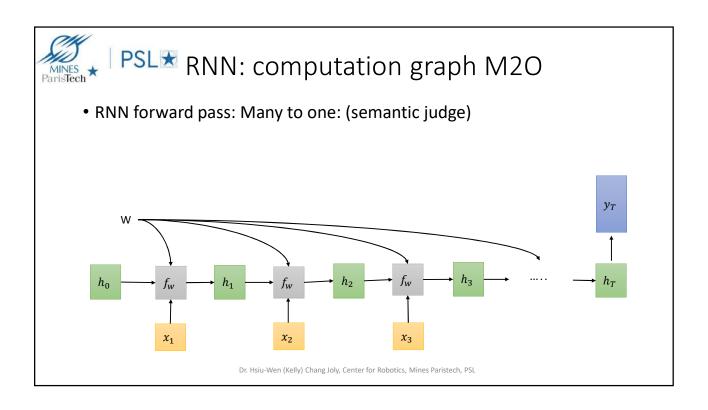

- The hidden state s of the RNN builds a kind of lossy summary of the past
- RNN totally adapted to processing SEQUENTIAL data (same computation formula applied at each time step, but modulated by the evolving "memory" contained in state s)
- Universality of RNNs: any function computable by a Turing Machine can be computed by a finite-size RNN (Siegelmann and Sontag, 1995)

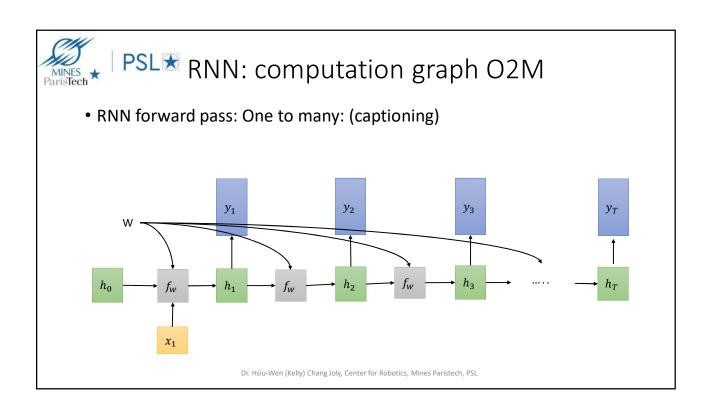

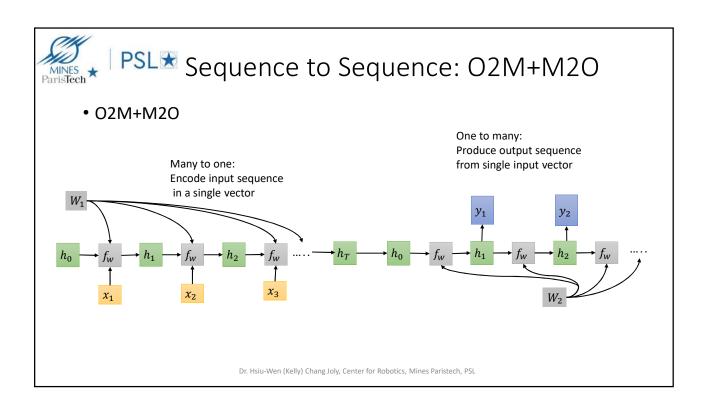

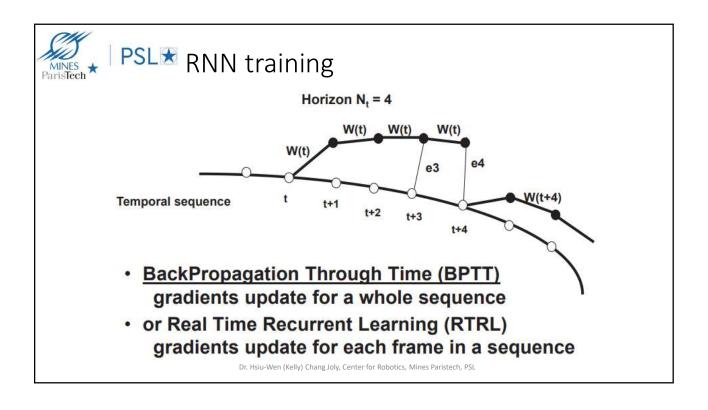

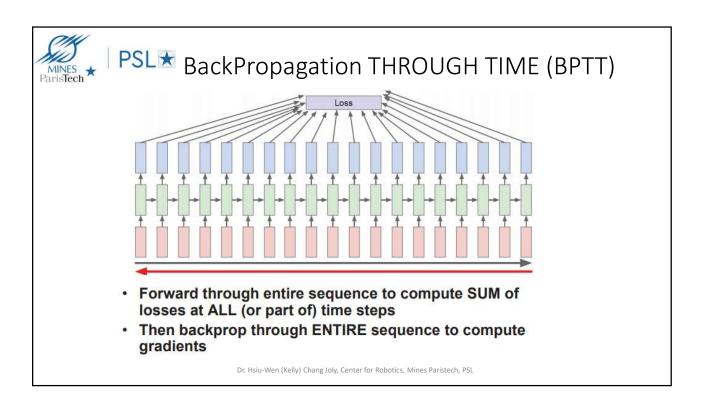

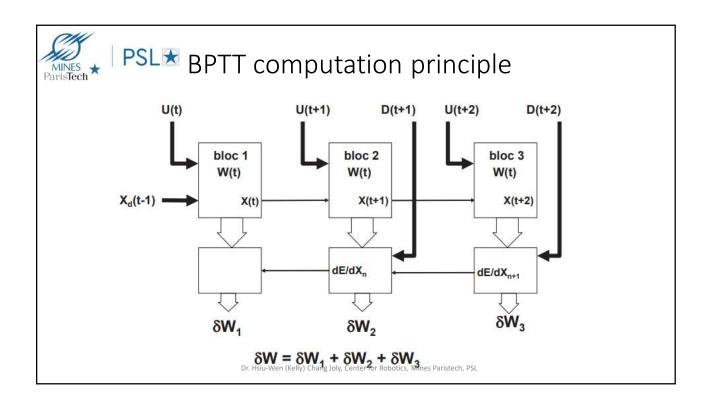

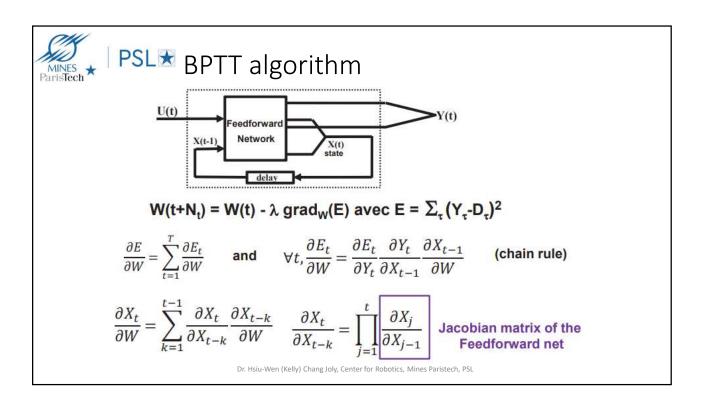

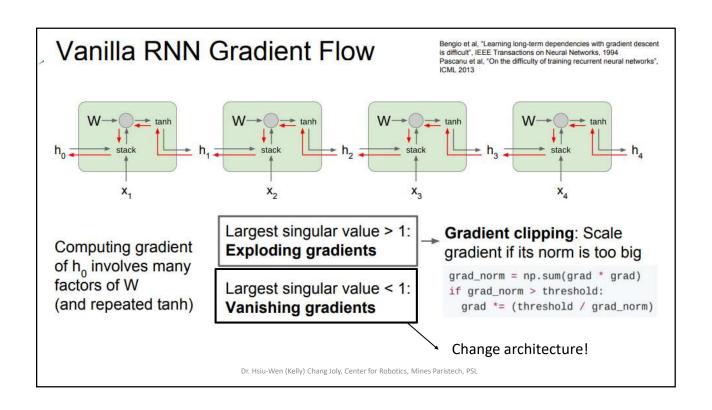

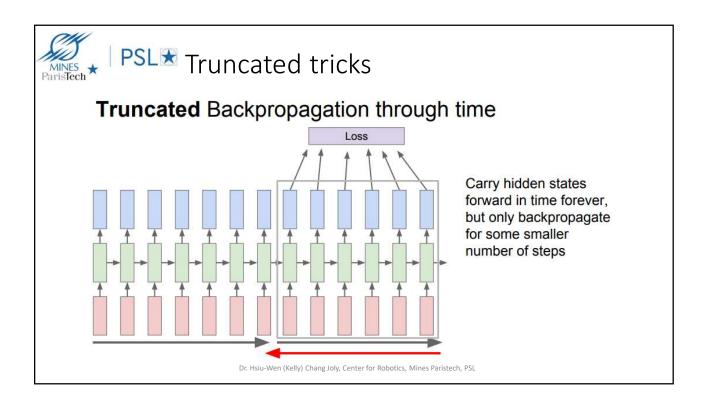

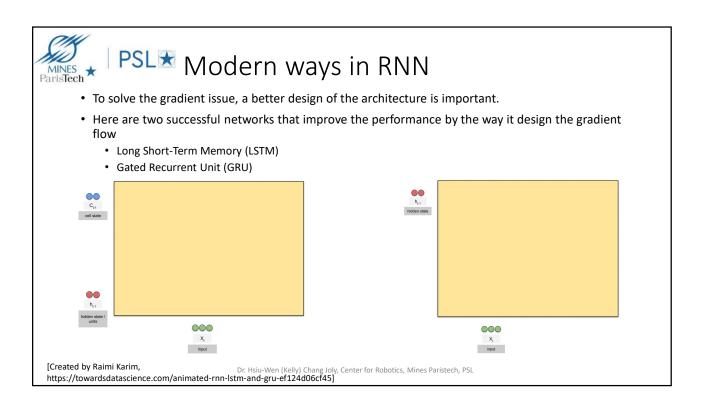

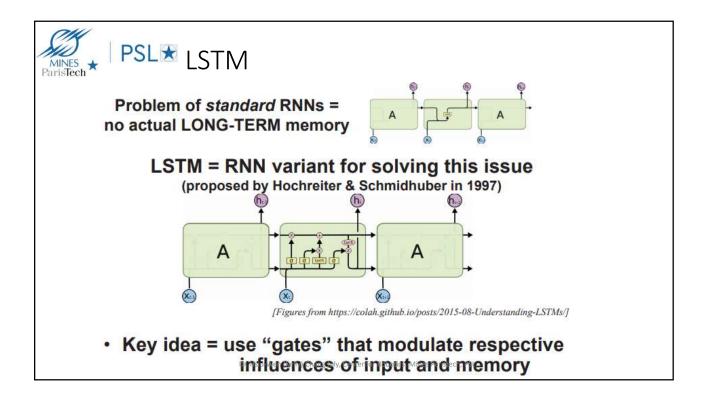

PSL Vanishing/exploding gradient problem

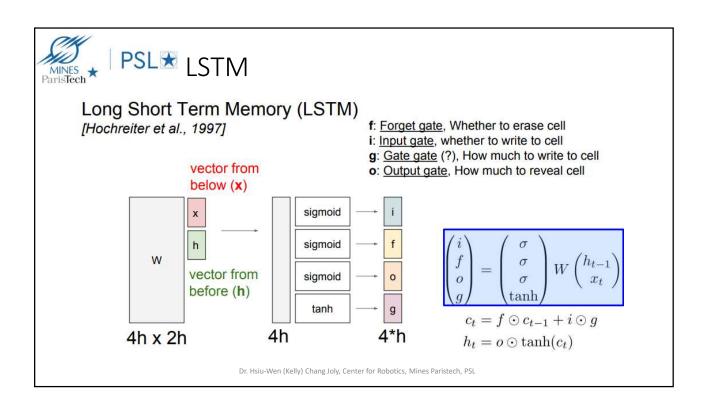

- If eigenvalues of Jacobian matrix >1, then gradients tend to EXPLODE
 → Learning will never converge.
- Conversely, if eigenvalues of Jacobian matrix then gradients tend to VANISH
- → Error signals can only affect small time lags
- → short-term memory.
- Possible solutions for exploding gradient: CLIPPING trick (limited values in an array, see numpy.clip), truncated.
- Possible solutions for vanishing gradient:
 - · use ReLU instead of tanh
 - · change what is inside the RNN!

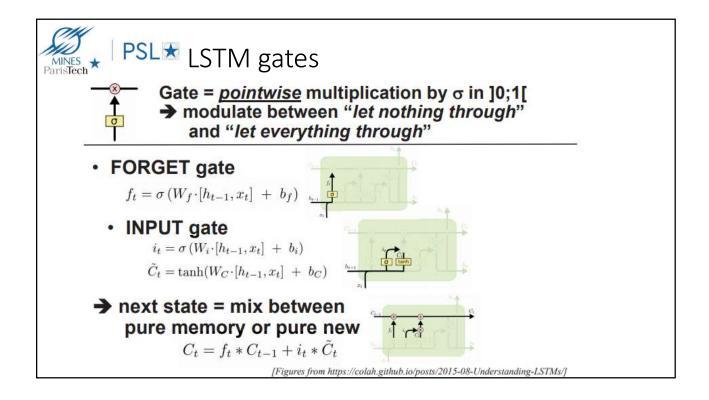

Recommended code to read for better understand this slide: https://gist.github.com/karpathy/d4dee566867f8291f086

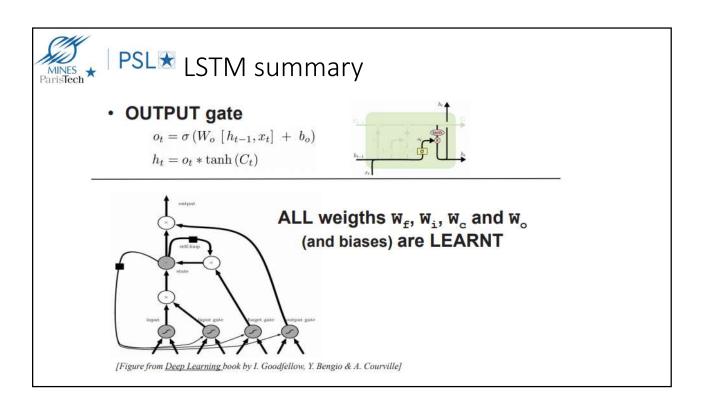

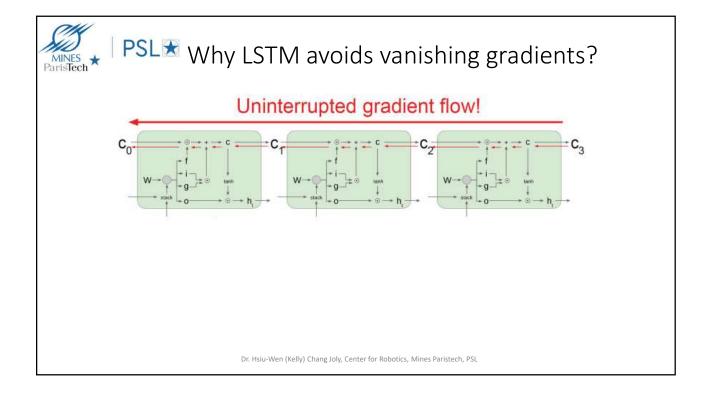

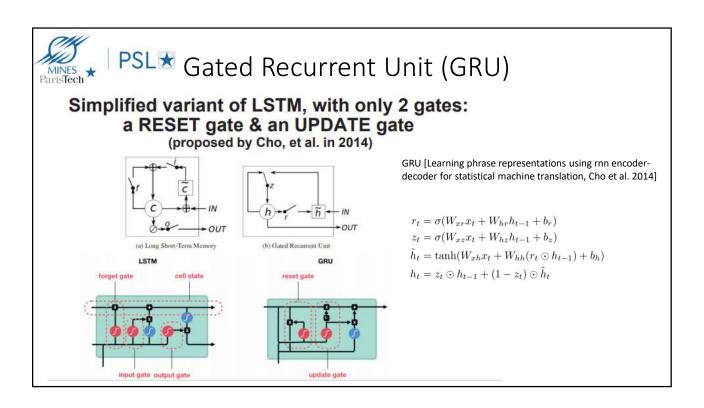

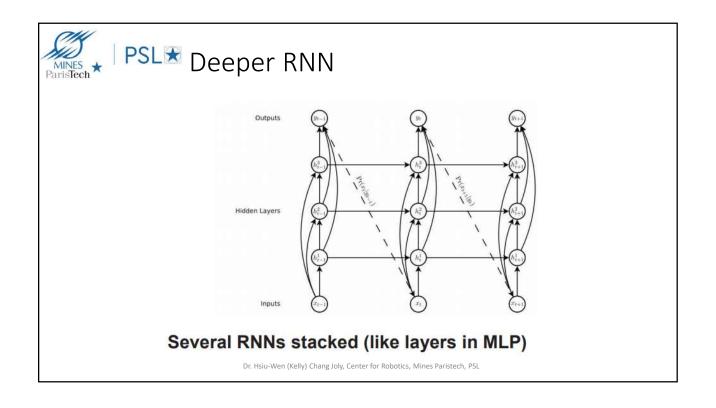

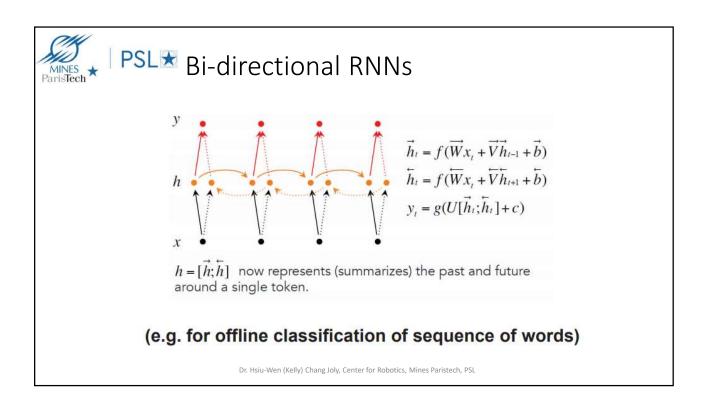

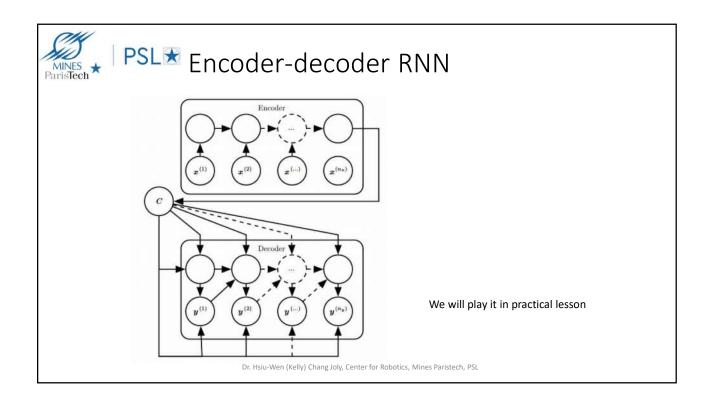

PSL Recommended reading: RNN variants

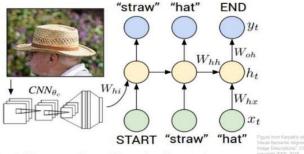

- [LSTM: A Search Space Odyssey, Greff et al., 2015]:
 - they play around the LSTM equations, swap out the non linearities at one point, do we need tanh, this paper made a lot of experiences in playing around different design
 - Conclusion is there is no significant difference.
- [An Empirical Exploration of Recurrent Network Architectures, Jozefowicz et al., 2015]:
 - Search over very large number of random RNN architecture, randomly permute these equations to see if there is a better one
 - Conclusion: No significant improvement with one specific version

PSL Visual Question Answering

- Q: What endangered animal Q: Where will the driver go is featured on the truck?
- A: A bald eagle.
- A: A sparrow.
 A: A humming bird.
- A: A raven.

- if turning right?
- A: Onto 24 % Rd.
- A: Onto 25 3/4 Rd. A: Onto 23 3/4 Rd.
- A: Onto Main Street.

- Q: When was the picture taken?
- A: During a wedding. A: During a bar mitzvah.
- A: During a funeral.
 A: During a Sunday church

- Q: Who is under the umbrella?
- A: Two women.
- A: A child. A: An old man.
- A: A husband and a wife.

PSL™ Applications of RNN/LSTM

Wherever data is intrinsicly SEQUENTIAL

- Speech recognition
- Natural Language Processing (NLP)
 - Machine-Translation
 - Image caption generator

- Gesture recognition
- Music generation
- Potentially any kind of time-series!!

Dr. Hsiu-Wen (Kelly) Chang Joly, Center for Robotics, Mines Paristech, PSL

Check GPT-3 that can be used in a large of different applications

PSL Summary

- RNNs allow a lot of flexibility in architecture design
- Vanilla RNNs are simple but don't work very well
- Common to use LSTM or GRU: their additive interactions improve gradient flow
- Backward flow of gradients in RNN can explode or vanish
- Exploding is controlled with gradient clipping
- Vanishing is controlled with additive interactions (LSTM)
- Better/simpler architectures are a hot topic of current research
- Better understanding (both theoretical and empirical) is needed.
